ABSTRACT OF THE DISCLOSURE

A substrate is plotted into a plurality of blocks, and each block is plotted into one or a plurality of device-forming regions. By using a first manufacturing line, a conductive film, an insulating film and a semiconductor film which constitute TFT are formed in Then, primary cutting is the device-forming region. performed to cut the substrate into the respective blocks and form a plurality of sub-TFT substrates. Then, by using a second manufacturing line, processing is performed for each sub-TFT substrate in accordance with liquid crystal panel specifications of а to Then, secondary cutting is performed to manufactured. cut the sub-TFT substrate into respective device-forming regions.
